Exercise #1 – Correct any invalid XHTML syntax

```xml
<?xml version = "1.0" encoding=utf-8 ?>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.1//EN"
 "http://www.w3.org/TR/xhtml11/DTD/xhtml11.dtd">
<!-- An example file
<!-- Our first Web page -->
<html xmlns = "http://www.w3.org/1999/xhtml">
<body>
<h1> Welcome to <b> IT350!</b> </h1>
<h2> Today’s Agenda </h2>
<li> XHTML
<li> JavaScript
</body>
</html>
```
Exercise #2 – Correct any invalid XHTML syntax

```xml
<?xml version = "1.0"?>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.1//EN"
"http://www.w3.org/TR/xhtml11/DTD/xhtml11.dtd">
<html xmlns = "http://www.w3.org/1999/xhtml">
  
  <title>Internet and WWW How to Program - Welcome</title>

  <body>
    
    <img src = "xmlhtp.jpg" height = "238" width = "183" >

    <h1 align="center">Under construction</h1>

  </body>

</html>
```

Exercise #1 -- What’s the output?

```javascript
var a, b, c;

a = 1;
b = 2;
c = 3;

d = a + b * c;

window.alert("<h1>Begin</h1>");

if (d < 20)
   window.alert("d is okay: "+d);
else
   window.alert("d is too high!:"+ d);

  d = d - 3;

document.writeln("<h1>Done. Final d = "+d"</h1>");
```
Exercise #2 -- What’s the output?

```javascript
var x, y, z;

x = 7;
y = 9;
z = "abc";

window.alert(x+y+z);
window.alert(z+y+x);
if (x)
    window.alert("x true");
x = "seven";
window.alert(x+y+z);
```

JavaScript Scope Rules

- Variables declared inside a function:
  - Explicitly (with var)
  - Implicitly (just used)
  - Parameters
    (Look at FIRST USE inside a function to decide which applies)

- Variables declared outside a function:
  - Explicitly
  - Implicitly
Exercise #1 – Write a function that takes two arguments and returns the minimum of the two

Exercise #2 – What’s the output?

```javascript
function fun1 (x) {
  x = x + 3;
  y = y + 4;
  document.writeln("<br/> FUN1: "+x+ "," +y);
}

function fun2 () {
  var y;
  x = x + 10;
  y = y + 20;
  document.writeln("<br/> FUN2: "+x+ "," +y);
}

x = 1;
y = 2;

document.writeln("<br/> MAIN #1: "+x+ "," +y);
fun1(x);
document.writeln("<br/> MAIN #2: "+x+ "," +y);
fun1(y);
document.writeln("<br/> MAIN #3: "+x+ "," +y);
fun2();
document.writeln("<br/> MAIN #4: "+x+ "," +y);
```
Exercise #1 – Change this code to make the `<p>` element have a bigger font when you move the mouse over it.

```html
<html xmlns = "http://www.w3.org/1999/xhtml">
  <head>
    <title>Bigger</title>
    <script type = "text/javascript">
    </script>
  </head>
  <body>
    <p>
      Welcome to my page!
    </p>
  </body>
</html>
```

Exercise #2 – Modify so that clicking on the button changes target of `<a>` element to “dog.html”

```html
<html xmlns = "http://www.w3.org/1999/xhtml">
  <head>
    <title>Change Link</title>
    <script type = "text/javascript">
    </script>
  </head>
  <body>
    <a href="cat.html">
      See some animals!
    </a>
    <form action="">
      <input type="button" value="Change animal"/>
    </form>
  </body>
</html>
```
Perl Basics

use CGI qw( :standard );
print( header() );

$x = 2 + 3;
$y = $x * 4;

if ($x == 5.0) {
    print ("x is five");
}

for ($i = 0; $i < 3; $i++) {
    $squared = $i * $i;
    print ("<br> $i = $i, squared is $squared");
}

$pet1 = "dog";
$pet2 = "ll" . "ama";

# Single quotes vs. double quotes
print ("<br/>I have a $pet1 and a $pet2.");
print ('<br/>I have a $pet1 and a $pet2.');

$comp1 = ($pet1 eq "dog");
print (<br/> comp1: $comp1);

Perl Stuff

“Scalar” variables:
    $x = 3;
    $y = "Hello";

“Array” variables:
    @list = (3, 7, "dog", "cat");
    @list2 = @list1;  # copies whole array!

A single element of an array is a “scalar:
    print "Second item is: $list[1]";  # Don’t use @

Get array length by treating whole array as scalar:
    $lengthOfList2 = @list2;

File operations
    open ( MYFILE, "input.txt" );
    open ( MYFILE, ">output.txt" );
    open ( MYFILE, ">>LOG.txt" );
File Access

- Ownership: Input/Output files usually NOT owned by “Web Server”.
  - Operating system may enforce read, write, and/or modify restrictions on I/O files
  - For file output/append, may need to create file prior to first use
  - File permissions need set for access by the “web server” account (Right-click on file, pick Properties, then set permissions like example on right)

Perl Function Calls (“subroutines”)

```perl
use CGI qw(:standard);
print( header() );

# Prints "hello", takes no arguments
sub hello {
    print "\n<br/> Hello.";
}

# Takes two arguments, return their product
sub multiply {
    my($valA, $valB) = @_; 
    return $valA * $valB;
}

my($x) = 2;
&hello;
print "\n<br/> $x * 7 = ". &multiply($x,7);
&hello();
&hello(72145);
print(end_html());
```
Function Calls and Arrays

# Takes an array as argument, returns minimum value
sub findMin {
    my ($array) = @_;  
    my $min = $array[0];
    my $ii;
    my $len = @array;
    for ($ii=0; $ii < $len; $ii++) {
        if ($array[$ii] < $min) {
            $min = $array[$ii];
        }
    }
    return $min;
}

# Defines new global array, @array1
# AND returns a new array with 4 elements.
sub makeArray() {
    @array1 = (89, 23, 90);
    my @array2 = (34, 5.4, 123, 2.01);
    return @array2;
}

@test1 = makeArray();
@test2 = (89, 23, 40, -17);
print "Min1 is: " . findMin(@test1);
print "Min2 is: " . findMin(@test2);
print "Min3 is: " . findMin(@array1);
print "Min4 is: " . findMin(@array2);
