Lesson 26. The Simplex Method – Example

Problem 1. Consider the following LP:

\[
\begin{align*}
\text{maximize} & \quad 4x_1 + 3x_2 + 5x_3 \\
\text{subject to} & \quad 2x_1 - x_2 + 4x_3 + s_1 = 18 \\
& \quad 4x_1 + 2x_2 + 5x_3 + s_2 = 10 \\
& \quad x_1, x_2, x_3, s_1, s_2 \geq 0
\end{align*}
\]

a. Construct the canonical form of this LP.

b. Use the simplex method to solve the canonical form LP you wrote in part a. In particular:
   
   - Construct your initial BFS and basis by making the nonslack variables having value 0.
   - Choose your entering variable using Dantzig's rule – that is, choose the improving simplex direction with the most positive reduced cost. (If this was a minimization LP, you would choose the improving simplex direction with the most negative reduced cost.)

c. What is the optimal value of the canonical form LP you wrote in part a? Give an optimal solution.

d. What is the optimal value of the original LP above? Give an optimal solution.

\[
\begin{align*}
\text{Let } \bar{x} &= (x_1, x_2, x_3, s_1, s_2) \\
\bar{x}^0 &= (0, 0, 0, 18, 10) \\
\mathcal{B}^0 &= \{s_1, s_2\} \\
A\bar{x}^0 &= 0 \\
\Rightarrow \bar{d}_x^1 &= (1, 0, 0, -2, -4) \\
\bar{c}_x^1 &= 4 \\
MRT: \quad \lambda_{\text{max}} &= \min \left\{ \frac{s_1}{\bar{d}_x^1}, \frac{s_2}{\bar{d}_x^1} \right\} = 2 \\
\Rightarrow \bar{x}^1 &= \bar{x}^0 + \lambda_{\text{max}}\bar{d}_x^1 = (0, 0, 2, 10, 0) \\
\mathcal{B}^1 &= \{x_3, s_1\}
\end{align*}
\]
\( \overline{x}^1 = (0, 0, 2, 10, 0) \quad \mathcal{B}^1 = \{x_3, s_i\} \)

\[ \overline{d}^x_1: \overline{d}^x_1 = (1, 0, d_x, d_s, 0) \]
\[ A \overline{d}^x_1 = 0: \quad 2 + 4d_x + d_s = 0 \quad 4 + 5d_x = 0 \]
\[ \Rightarrow \overline{d}^x_1 = (1, 0, -\frac{4}{5}, \frac{4}{5}, 0) \quad \overline{c}_x = 0 \]

\[ \overline{d}^x_2: \overline{d}^x_2 = (0, 1, d_x, d_s, 0) \]
\[ A \overline{d}^x_2 = 0: \quad -1 + 4d_x + d_s = 0 \quad 2 + 5d_x = 0 \]
\[ \Rightarrow \overline{d}^x_2 = (0, 1, -\frac{2}{5}, \frac{13}{5}, 0) \quad \overline{c}_x = 1 \quad \text{choose } x_2 \text{ as entering} \]

\[ \overline{d}^x_3: \overline{d}^x_3 = (0, 0, d_x, d_s, 1) \]
\[ A \overline{d}^x_3 = 0: \quad 4d_x + d_s = 0 \quad 1 + 5d_x = 0 \]
\[ \Rightarrow \overline{d}^x_3 = (0, 0, -\frac{4}{5}, \frac{4}{5}, 1) \quad \overline{c}_x = -1 \]

MRT: \( \lambda_{\text{max}} = \min \left\{ \frac{x_3}{x_2} \right\} = 5 \quad \text{\(x_3\) is leaving} \)

\[ \Rightarrow \overline{x}^2 = \overline{x}^1 + \lambda_{\text{max}} \overline{d}^x_3 = (0, 5, 0, 23, 0) \quad \mathcal{B}^2 = \{x_2, s_i\} \]

\[ \overline{x}^2 = (0, 5, 0, 23, 0) \quad \mathcal{B}^2 = \{x_2, s_i\} \]

\[ \overline{d}^x_1: \overline{d}^x_1 = (1, d_x, 0, d_s, 0) \]
\[ A \overline{d}^x_1 = 0: \quad 2 - d_x + d_s = 0 \quad 4 + 2d_x = 0 \]
\[ \Rightarrow \overline{d}^x_1 = (1, -2, 0, -4, 0) \quad \overline{c}_x = -2 \]

\[ \overline{d}^x_2: \overline{d}^x_2 = (0, d_x, 1, d_s, 0) \]
\[ A \overline{d}^x_2 = 0: \quad 4 - d_x + d_s = 0 \quad 5 + 2d_x = 0 \]
\[ \Rightarrow \overline{d}^x_2 = (0, -\frac{5}{2}, 1, -\frac{13}{2}, 0) \quad \overline{c}_x = -\frac{5}{2} \]

\[ \overline{d}^x_3: \overline{d}^x_3 = (0, d_x, 0, d_s, 1) \]

No simplex directions are improving \( \Rightarrow \overline{x}^2 \) is optimal, \( \overline{w} \) value 15.

d. In the original LP, \( x_1 = 0, x_2 = 5, x_3 = 0 \) is an optimal solution, \( \overline{w} \) value 15.
